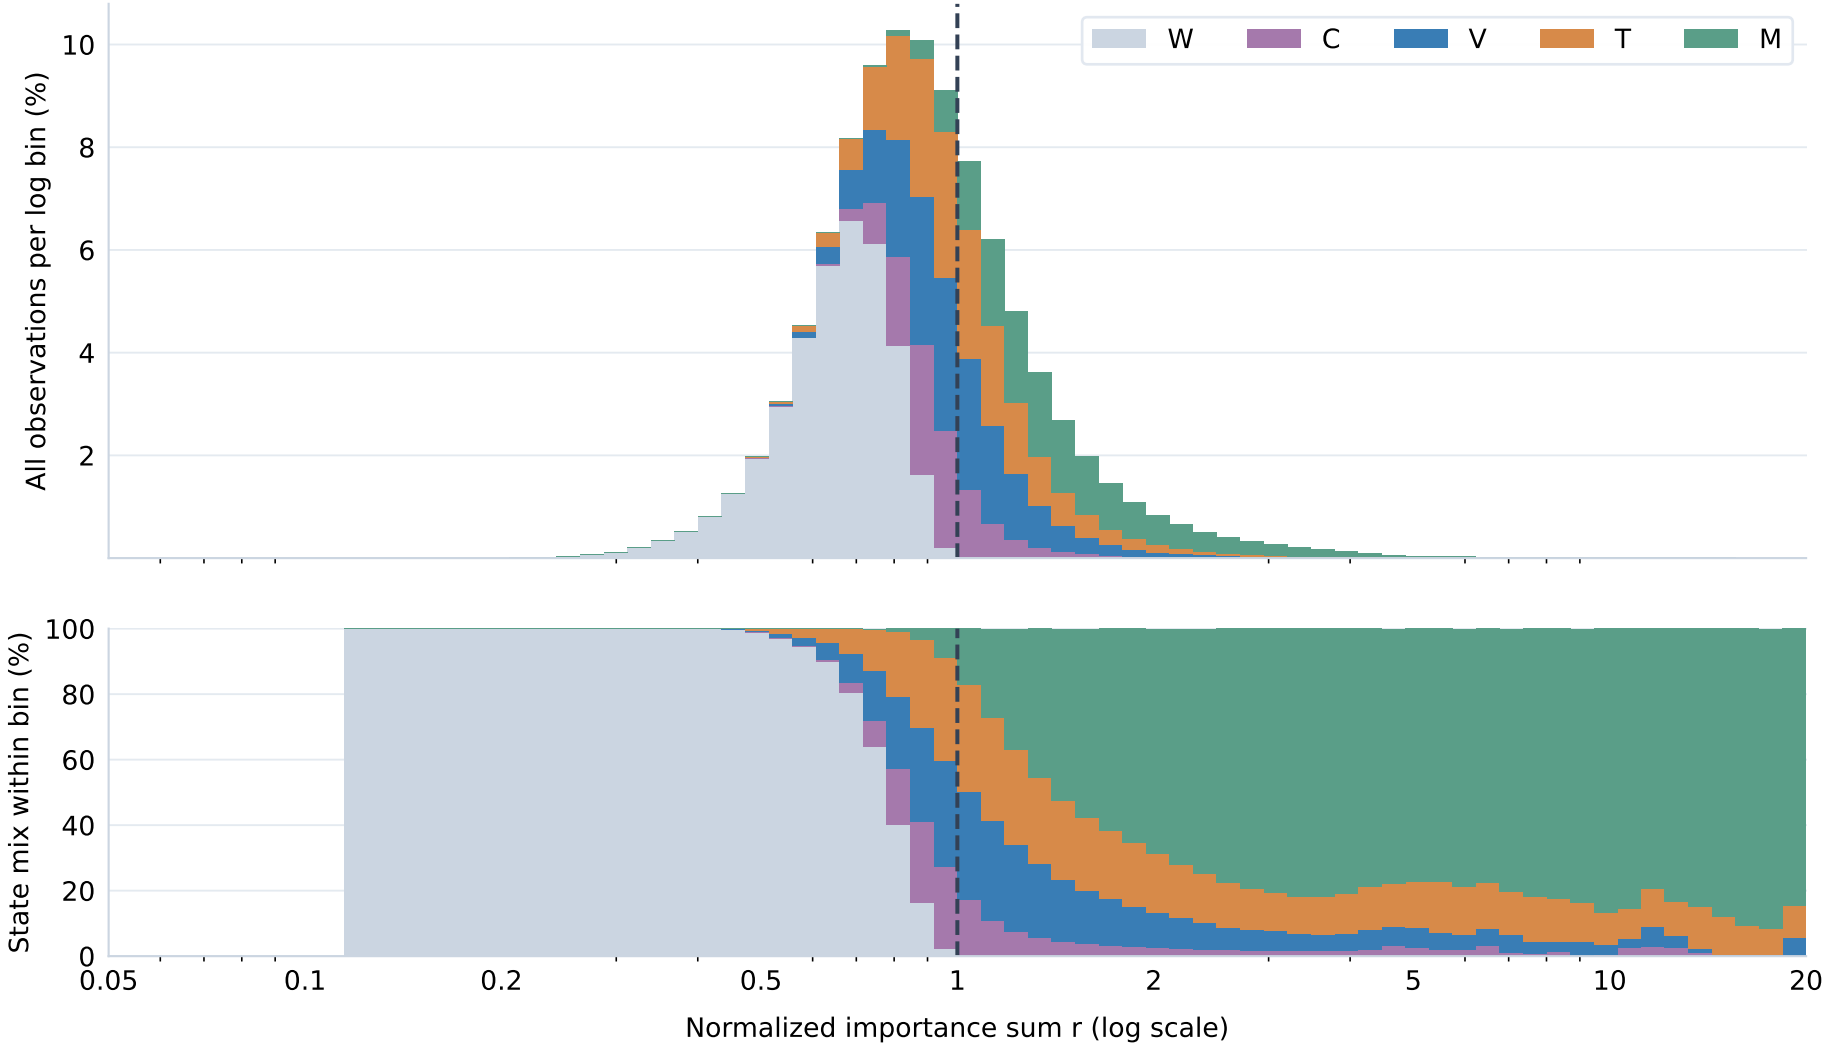
Modality-aware importance sum

llava_1_5_7b | MME | 1,000 frozen inputs

r = d_ff (qV + qT + qC) / 3; layer mean r = 1 by construction



Dashed line: r = 1. W implies r ≤ 1, but r ≤ 1 does not imply W; individual V/T/C thresholds define W.

Each real neuron × sample counted once; layers weighted by true width. 0.012% outside x-range.
