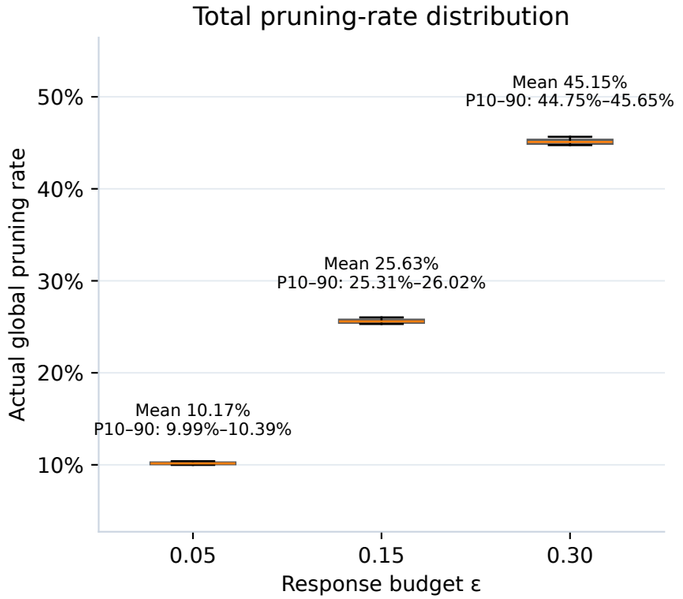
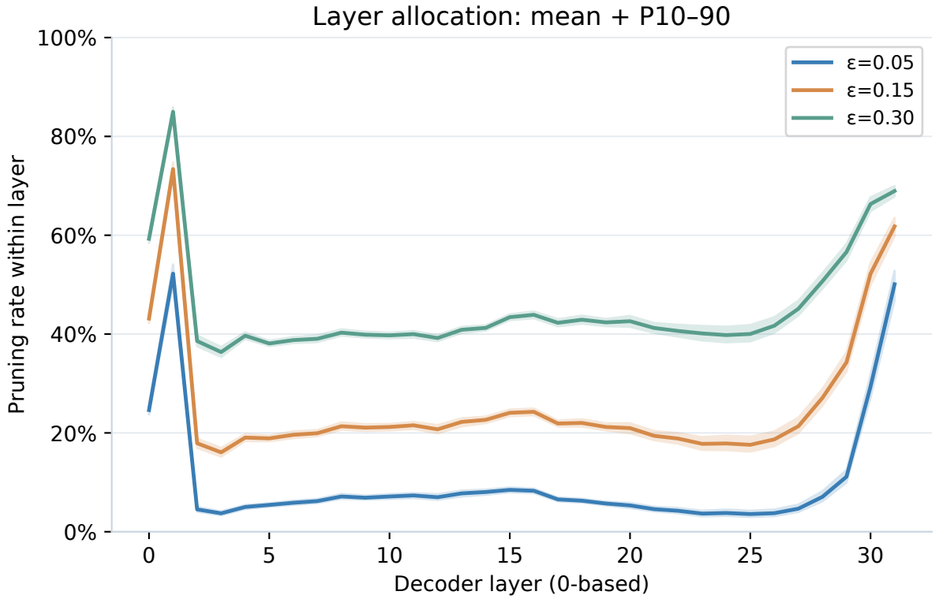
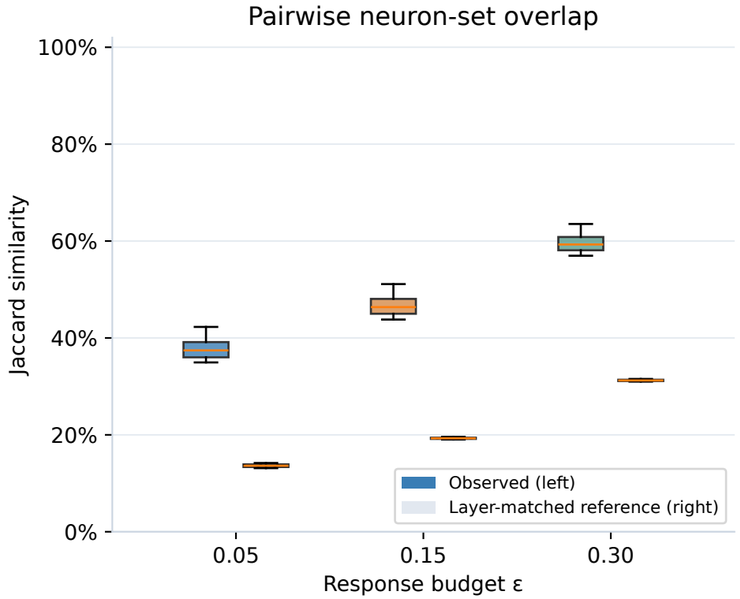
Sample variability of nonuniform pruning

LLaVA-1.5-7B | MME | 1,000 samples | 2,000 cross-group pairs

Same response budget; real neuron identities preserved for overlap tests







Boxes: median / P25–75; whiskers: P10–90. Left axis is focused. Layer bands show sample spread, not CIs.

Reference = E[intersection] / (Ka + Kb − E[intersection]), preserving each sample's deletion count in every layer.

Cross-group sample pairs are descriptive and not independent replicates. This test does not measure accuracy or speed.
